

COMICCRAFT

AI Comic Story Creator using Gemini Models

Brainstorming & Ideation Phase

Introduction and Project Need

The Brainstorming and Ideation Phase begins the ComicCraft project. The team identifies the need for an AI-based tool that can help users create comic stories more easily. Comic creation normally involves developing a story, characters, scenes, dialogues and a logical sequence of events. ComicCraft proposes using Gemini models to support these creative tasks. The main purpose is to provide a simple workflow where a user can enter an idea and receive structured comic story content. This phase establishes the foundation for the remaining project activities.

Problem Identification and Brainstorming

The team identifies difficulties faced by beginners and students when creating comics. They may have an idea but struggle to develop characters, write dialogues, organize scenes or maintain a story sequence. Brainstorming is used to explore possible solutions. Ideas such as an AI story generator, character assistant, dialogue generator, scene planner and comic-panel assistant are considered. Each idea is examined for usefulness, feasibility, required technology and ease of implementation.

COMICCRAFT – Brainstorming & Ideation Phase

Initial Ideas and Evaluation

Several possible approaches are evaluated before selecting the final concept. The team considers a basic story-writing application, an AI chatbot for creative writing, a character generator, a scene generator and a complete comic-story assistant. The ideas are compared according to user benefit, technical feasibility, development effort and future expansion. The evaluation helps the team identify a solution that combines storytelling support with AI-generated structured content.

Selection of ComicCraft and Project Vision

ComicCraft is selected as the project idea: an AI Comic Story Creator using Gemini models. The system is intended to accept a story concept and generate a title, characters, scenes, dialogues and panel suggestions. The vision is to make comic-story creation simpler and more accessible. The project can demonstrate a practical use of Generative AI for creative content creation while keeping the user interaction simple.
